1. Welcome

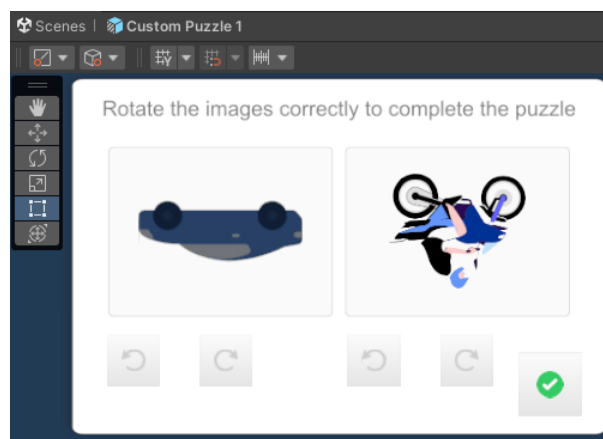

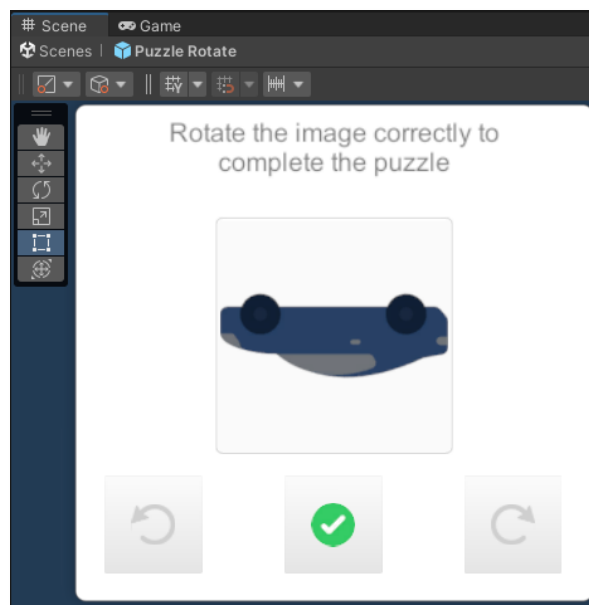

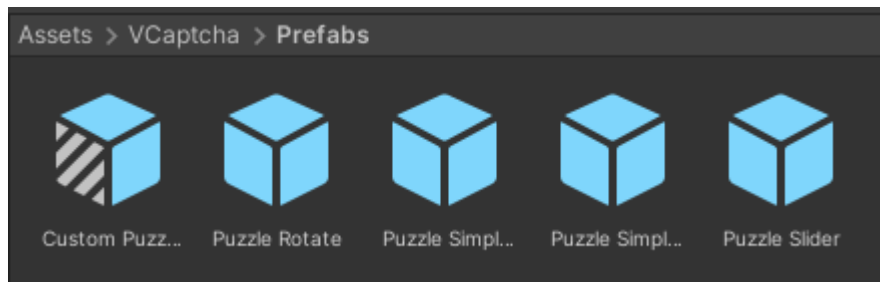

1.1. Introduction

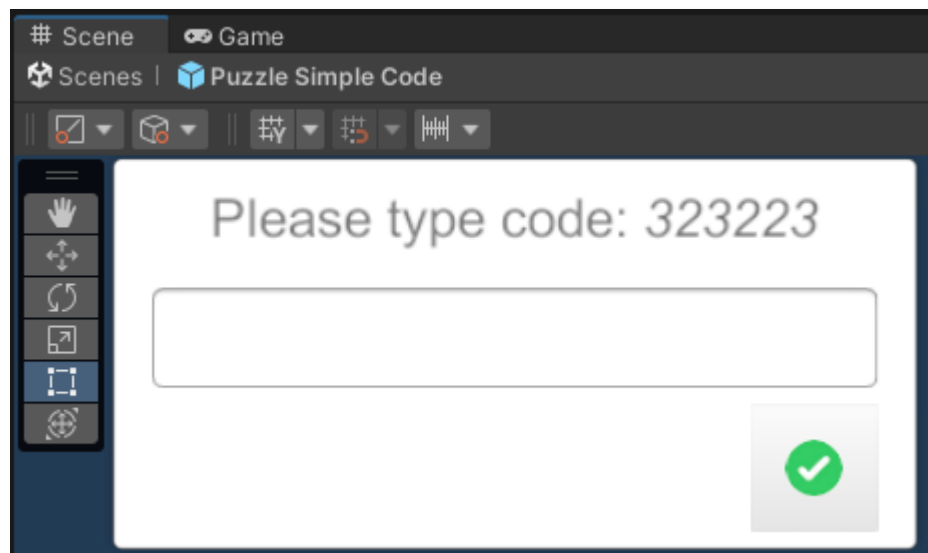

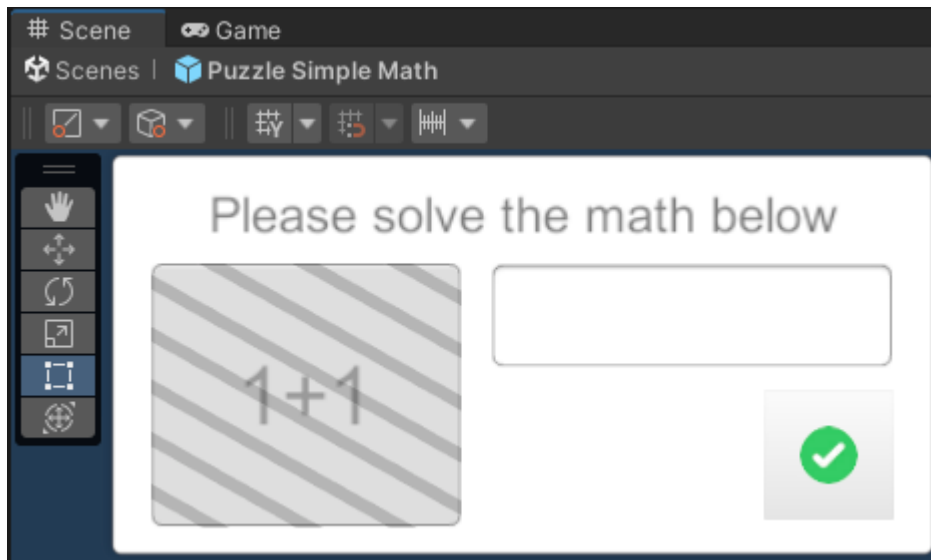

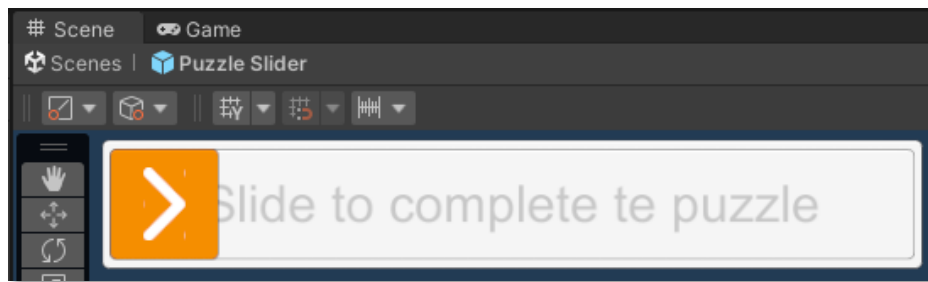

This package provides a solution to prevent spam from user-created content, screen macros, etc. You can use some ready-to-use captchas or create your own captcha through the components present in the package.

2. Getting Started

2.1. Ready-to-use captchas

Some captchas are ready to use, just instantiate them and configure their action events.

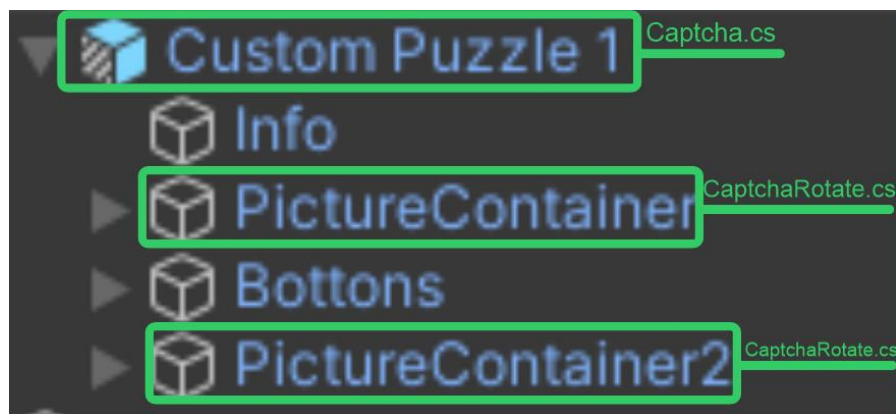

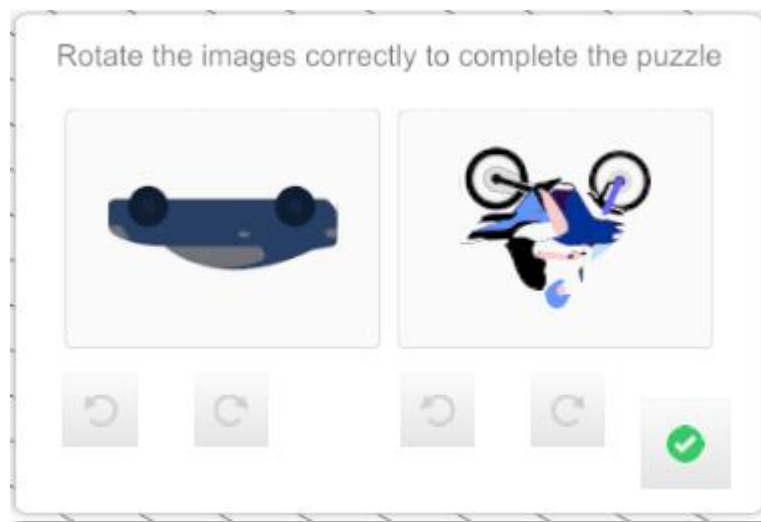

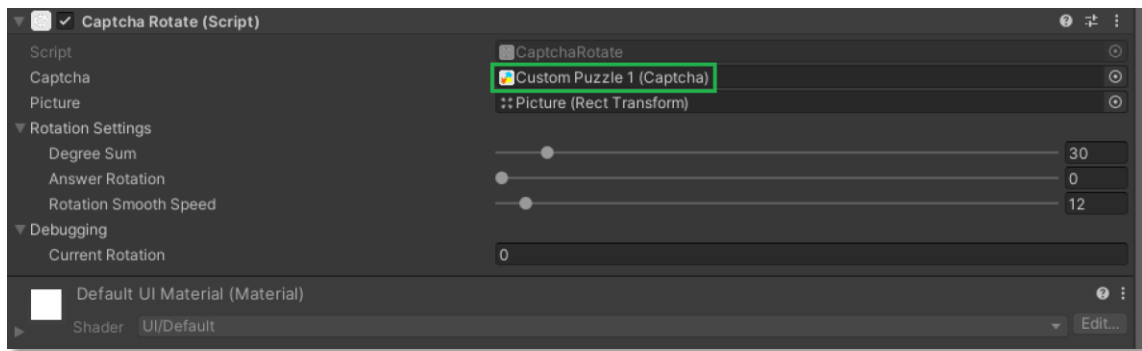

2.1. Custom captchas

It is possible to combine different puzzles in a single captcha through the components present in the package.

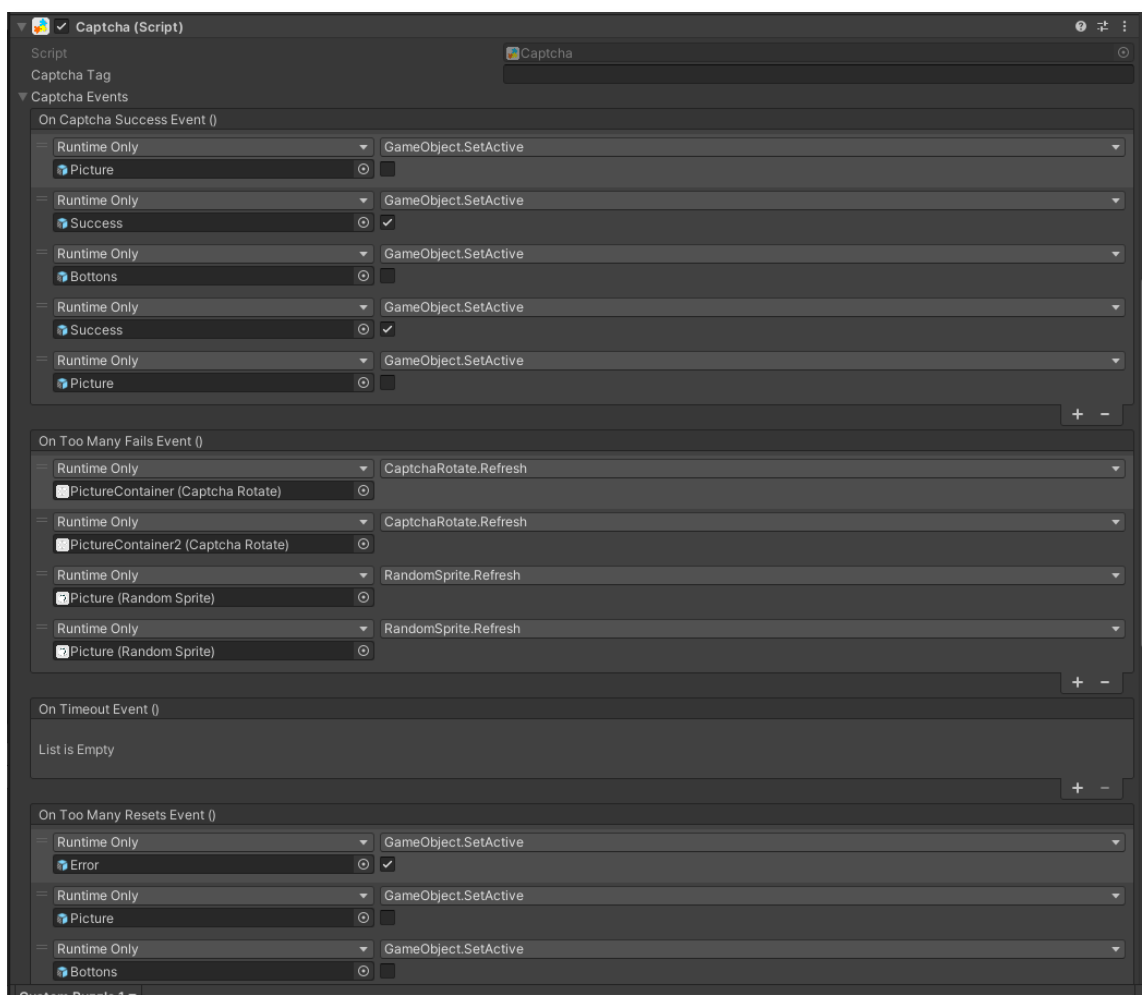

For example, in this image you can see that two rotation puzzles were added in a single Captcha. Assigning the Captcha to the puzzles in the inspector will automatically make the Captcha detect the status of both (correctly or incorrectly rotated). It could be 3 or more, or combining the rotation puzzle with the math puzzle for example.

Some events were added to carry out actions according to the user's behavior in the captcha.

The "Confirm" function serves to confirm whether in fact the puzzles have been completed or not. If they were completed, it will call the success event, if the answer is wrong, it will add failure points until calling the failure event.
